

application protocol

1. Apply protection, such as gauze or cotton, across the eyes. Tear open the pouch, remove and unfold the masque.
2. Remove the first layer of protective film and apply the masque to the face, adjusting to the client's facial contours.
3. Remove the second layer of the protective film and smooth the masque with fingertips, ensuring a comfortable fit.
4. Leave the masque on for 5-15 minutes, depending on the type of service performed and level of inflammation or dehydration

Please note: For advanced services like lasers, IPL or microneedling, the masque will be applied for 3 minutes due to the extreme Trans epidermal Water Loss skin experiences.

5. Gently remove the masque by lifting from the corners and discard into a waste bin.
6. Massage any remaining residue into the skin and proceed with the dermal layering products as needed and depending on the service provided.
